Using LuaLaTeX to typeset RTL texte with \eledpar

Abstract

This file provides an example on how to use eledpar and LuaLaTeX to typeset a right to left text with its translation on the facing page.\footnote{The text was provided by Latechneuse on \url{http://tex.stackexchange.com/q/227837/7712}}

As you can see, the switch to RTL convention is made \texttt{before} the \texttt{pstart}. It must be also called inside \texttt{\eledsection}.

For an example with \texttt{XeLaTeX}, look at \texttt{parallel-column-two-languages.tex} file.
