Abstract

This package manages the new and extended features and resources that \LaTeX{} provides. Examples are attributes and catcode tables.

1 Documentation

1.1 Introduction

\TeX\ provides global resources such as registers. But it does not provide an interface for managing these resources. For example, two packages want to use a counter register. If they take the same register number, then the use of both packages will conflict and they cannot be used together. Therefore formats such as plain \TeX\ or \LaTeX\ implement an allocation scheme for registers. A package reserves with \texttt{\newcount} an unused register number for its own exclusive use.

Nowadays \TeX\ is not alone anymore: \$\varepsilon$-\TeX, pd\TeX\ and other compilers for \TeX\ are developed that extend and add new features and resources.

Now \LuaTeX\ has reached beta state. It inherits most of pd\TeX\’s features including $\varepsilon$-\TeX. Also it implements new concepts such as attributes or catcode tables.

1.1.1 \LaTeX\n
\LaTeX\ has inherited its resource handling from plain \TeX. The interface is basically the same: \texttt{\newcount}, ...Therefore this package tries to follow this tradition by providing compatibility to plain \TeX. It can be loaded with plain \TeX\ and defines at least some of the features that this packages provides for \LaTeX.
1.2 Register allocation

1.2.1 Register with 16 bit

Because LuaTeX is a super set of \( \varepsilon \)-TEX regarding registers, the register allocation scheme should not conflict with package etex. Therefore this package is loaded to inherit its allocation scheme. The only change is currently that the limit is increased to 65536 registers for the following register classes:

- count
- dimen
- skip
- muskip
- marks
- toks
- box

This affects the number of global and local registers. Because it is done in a package and not in the kernel, it is possible that someone loads package etex before uses the local allocation variants. This will prevent the extension for this register class. If more registers are needed, just load package lualatex earlier.

1.2.2 Insertions

Insertions need four registers \textbackslash count, \textbackslash dimen, \textbackslash skip, and \textbackslash box with the same number. Usually they are allocated downwards from 254, 253, ... Also \texttt{newcount}, \texttt{newdimen}, ... fill up these register numbers from below before switching to higher register numbers by package etex. When this occurs, no insertions can be allocated anymore.

Therefore \texttt{newcount}, \texttt{newdimen}, \texttt{newskip}, and \texttt{newbox} are replaced by their global variants (\texttt{globcount}, ...) that use the higher numbers immediately, leaving the room for insertions. There should not be an efficiency penalty because LuaTeX stores the registers of a class in the same Lua table unlike \( \varepsilon \)-TEX, where registers below 256 are stored in an array and higher numbers are put in a tree structure.

1.3 Attributes

Nodes can have custom attributes in LuaTeX. These attributes are organized by a new register class. As the other registers up to \( 2^{16} \) attributes are supported. An attribute value can be negative that means the attribute is not set. Otherwise \TeX's range of non-negative integers up to \( 2^{31} \) are available.

\begin{verbatim}
\newattribute \{\langle cmd \rangle\}
\end{verbatim}

Macro \texttt{\newattribute} defines command \texttt{\langle cmd \rangle} using \texttt{\attributedef} using an new attribute number. The new attribute is initially unset.

\begin{verbatim}
\setattribute \{\langle cmd \rangle\} \{\langle value \rangle\}
\end{verbatim}

Macro \texttt{\setattribute} locally sets attribute command \texttt{\langle cmd \rangle} to the number \texttt{\langle value \rangle}. Valid values range from \(-1\) until \(2^{31}\) (the upper limit is the same as for other \TeX integer numbers).

\begin{verbatim}
\unsetattribute \{\langle cmd \rangle\}
\end{verbatim}

Macro \texttt{\unsetattribute} clears the attribute command \texttt{\langle cmd \rangle}.
1.4 Catcode tables

LuaTEX introduces catcode tables as new feature, see documentation. There is need for discussion, how to deal best:

- `{\initcatcodetable and \setcatcodetable} act globally.
- `{\catcodetable} causes an error if used with an uninitialized catcode table.
- Large catcode table numbers should be avoided because of performance breakdown.
- Use case \LaTeX{} package: The package must not be surprised by changed catcodes and must not surprise by changing catcodes accidently. Catcode tables could offer a solution. At the begin a catcode regime with standard catcodes is established and the old one is restored afterwards.
- Use case: LuaTEX’s `{\texttt{tex.print}} might be used with a catcode table number, for example a table where all entries have catcode “other”.
- Readonly catcode tables.
- Is there is a need for local allocations? (Package etex’s `{\texttt{\loc}} variants are not used in \TeX{} Live 2007.)

1.4.1 Interface proposal

The idea: `{\texttt{\newcatcodetable}} allocates odd numbered catcode tables. Even numbered tables are managed as stack. Also some catcode tables are defined. These must not be changed.

```
\newcatcodetable {⟨cmd⟩}
```

Macro `{\texttt{\newcatcodetable}} reserves a new catcode table and remembers its number in ⟨cmd⟩. The catcode table is initialized with ini-\TeX{}’s catcodes.

```
\texttt{\CatcodeTableIniTeX}
\texttt{\CatcodeTableString}
\texttt{\CatcodeTableOther}
\texttt{\CatcodeTableLaTeX}
```

These are catcode tables and must not be changed. `{\texttt{\CatcodeTableIniTeX}} contains the catcode settings of ini-\TeX{}. `{\texttt{\CatcodeTableString}} follows \TeX{}’s convention of `{\texttt{\string}}, `{\texttt{\meaning}} and friends. The space gets catcode 10 (space), the other characters have catcode 12 (other). In `{\texttt{\CatcodeTableOther}} all entries have catcode 12 (other). `{\texttt{\CatcodeTableLaTeX}} contains the setting of a pure \LaTeX{} format (‘at’ is other).

```
\CatcodeTableStack
\IncCatcodeTableStack
\DecCatcodeTableStack
```

 `{\texttt{\CatcodeTableStack}} is the stack pointer. Initially it is catcode table zero. `{\texttt{\IncCatcodeTableStack}} and `{\texttt{\DecCatcodeTableStack}} increments and decrements the stack pointer. Currently `{\texttt{\IncCatcodeTableStack}} does not initialize a new catcode table. Both increment and decrement operations do not set a catcode table.
It can be handy to have a global stack for catcode table numbers to deal with the global assignment property of \initcatcodetable and \savecatcodetable. \PushCatcodeTableNumStack pushes the current catcode table on the stack. \PopCatcodeTableNumStack pops the topmost number off the number stack to set the current catcode table. Catcode table zero is used in case of an empty stack.

\BeginCatcodeRegime {⟨catcodetable⟩} \EndCatcodeRegime

\BeginCatcodeRegime remembers the current catcode table number. Then it creates and uses a fresh catcode table on the stack that is initialized by ⟨catcodetable⟩:

\PushCatcodeTableNumStack
\catcodetable(⟨catcodetable⟩) \IncCatcodeTableStack
\savecatcodetable\CatcodeTableStack
\catcodetable\CatcodeTableStack

\EndCatcodeRegime drops the catcode table, created by \BeginCatcodeRegime and sets the catcode table that was active before:

\DecCatcodeTableStack
\PopCatcodeTableNumStack

These macros solve the use case, described earlier for a LaTeX package:

\% package foobar.sty
\BeginCatcodeRegime\CatcodeTableLaTeX
\makeatletter
\% ... package contents ...
\EndCatcodeRegime
\% end of package

If the package wants to change catcodes after its loading, \AtBeginDocument or \AtEndOfPackage can be used.

\SetCatcodeRange {⟨from⟩} {⟨to⟩} {⟨catcode⟩}

The catcodes of characters in range from ⟨from⟩ to inclusive ⟨to⟩ are set to ⟨catcode⟩.

1.5 Lua module loading

Currently LuaLaTeX (version 0.20) does not support Lua script files inside TDS:scripts//, because Lua’s mechanism for module loading does not use the kpathsea library. Therefore this packages appends a kpse loader to the list of Lua’s module loaders. It finds the module ⟨module⟩ by

kpse.find_file("⟨module⟩.lua", "texmfscripts")

Unhappily kpathsea does not support directory components in a file name. Therefore the Lua convention is not followed to replace dots in the module name by the directory separator.

Example: A Lua script of a package foobar wants the following modules:

require("foobar.hello.world")
require("org.somewhere.xyz")

Then they can be find in:
I would have preferred the following locations, following lua conventions, e.g.:

TDS:scripts/foobar/hello/world.lua
TDS:scripts/foobar/org.somewhere.xyz.lua

But I do not know, how to achieve this in a reliable way using kpathsea.

1.5.1 Package luatex-loader

If someone do not need or want package luatex but it’s extension for module loading, then he can use package luatex-loader. Both plain TeX and \LaTeX{} are supported.

2 Implementation

2.1 Reload check and package identification

Reload check, especially if the package is not used with \LaTeX{}.

2.3 Check for LuaTeX

Without LuaTeX there is no point in using this package.

\begin{enumerate}
\item[\def\luatexversion\ifnum\luatexversion<36\relax]
\item[\else]
\item[\def\LuT@MakePrimitive#1{\begingroup\expandafter\expandafter\expandafter\endgroup\expandafter\ifx\csname luatex#1\expandafter\endcsname\relax]
\item[\else]
\item[\def\LuT@MakeLuatexPrimitive#1{\begingroup\expandafter\expandafter\expandafter\endgroup\expandafter\ifx\csname luatex#1\expandafter\endcsname\relax]
\item[\else]
\begin{enumerate}
\item[\ifnum\luatexversion<36\relax]
\item[\else]
\item[\if\LuT@AtEnd\noexpand\endinput]
\end{enumerate}
\end{enumerate}

2.4 Provide LuaTeX primitives

\begin{enumerate}
\item[\def\LuT@MakeLuatexPrimitive#1{\begingroup\expandafter\expandafter\expandafter\endgroup\expandafter\ifx\csname luatex#1\expandafter\endcsname\relax]
\item[\else]
\item[\if\LuT@AtEnd\noexpand\endinput]
\end{enumerate}
2.5 Inherit support for \TeX\ for -\TeXeX

Package etex is not compatible for plain \TeX. But it could be present if a format is used that is based on etex.src. Therefore we only load the package in case of \TeXeX and tests its presence independently of the format by looking for \et@xins.
2.6 Adaption of -\TeX{}’s register allocation

\e-\TeX{} has increased the number of \TeX{} registers from $2^8$ (256) to $2^{15}$ (32768) for a register class. Lua\TeX{} extends the limit further to $2^{16}$ (65536). The allocation scheme of package etex is not changed. But this can be subject for discussion.

If a register class hasn’t registered any local registers yet, then the limit can safely be pushed to 65536.

\begin{verbatim}
\def\LuT@temp#1{%
  \ifnum\count27#1=32768 \count27#1=65536 \fi
}
\LuT@temp0%
\LuT@temp1%
\LuT@temp2%
\LuT@temp3%
\LuT@temp4%
\LuT@temp5%
\LuT@temp6%
\end{verbatim}

\e-\TeX{} uses an array for the first 256 registers and then a tree structure. Lua\TeX{} stores all registers of a class in one Lua table. There shouldn’t be large performance differences. This allows starting immediately in the extended area, leaving room for insertions.

\begin{verbatim}
\let\newcount\globcount
\let\newdimen\globdimen
\let\newskip\globskip
\let\newbox\globbox
\end{verbatim}

Currently LuaTeX does not use KPSE when searching for module files. The following Lua script implements a workaround. It extends package.loader by another search method. Modules are found by the module name with extension .lua similar to kpsewhich --format=texmfscripts \module\.lua

Unhappily kpsewhich does not support directory components in the file name. Therefore a module a.b.c cannot be installed as a/b/c.lua. The script must be named a.b.c.lua.

module("oberdiek.luatex", package.seeall)
function kpse_module_loader(module)
  local script = module .. ".lua"
  local file = kpse.find_file(script, "texmfscripts")
  if file then
    texio.write_nl("( .. file .. ")")
    dofile(file)
  else
    error("File `" .. script .. "' not found")
  end
end
return kpse_module_loader
end
return "\n\toberdiek.luatex.kpse_module_loader\n\tSearch failed"
end
table.insert(package.loaders, kpse_module_loader)

\end{verbatim}
```

4 Installation

4.1 Download

Package. This package is available on CTAN:\footnote{ftp://ftp.ctan.org/tex-archive/}

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard “A Directory Structure for \LaTeX\ Files” (CTAN:tds/tds.pdf). Directories with \texttt{texmf} in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the \texttt{oberdiek.tds.zip} in the TDS tree (also known as \texttt{texmf} tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script \texttt{pdfatfi.pl} that should be installed in such a way that it can be called as \texttt{pdfatfi}. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The \texttt{.dtx} file is a self-extracting \texttt{docstrip} archive. The files are extracted by running the \texttt{.dtx} through plain \LaTeX:  

```
tex luatex.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as \texttt{texmf} tree):

```
luatex.sty → tex/generic/oberdiek/luatex.sty
luatex-loader.sty → tex/generic/oberdiek/luatex-loader.sty
oberdiek.luatex.lua → scripts/oberdiek/oberdiek.luatex.lua
luatex.pdf → doc/latex/oberdiek/luatex.pdf
test/luatex-test1.tex → doc/latex/oberdiek/test/luatex-test1.tex
test/luatex-test2.tex → doc/latex/oberdiek/test/luatex-test2.tex
test/luatex-test3.tex → doc/latex/oberdiek/test/luatex-test3.tex
test/luatex-test4.tex → doc/latex/oberdiek/test/luatex-test4.tex
test/luatex-test5.tex → doc/latex/oberdiek/test/luatex-test5.tex
luatex.dtx → source/latex/oberdiek/luatex.dtx
```

If you have a \texttt{docstrip.cfg} that configures and enables \texttt{docstrip}'s TDS installing feature, then some files can already be in the right place, see the documentation of \texttt{docstrip}.

4.4 Refresh file name databases

If your \texttt{\LaTeX\} distribution (\texttt{te\LaTeX}, \texttt{mik\LaTeX}, ...) relies on file name databases, you must refresh these. For example, \texttt{te\LaTeX} users run \texttt{texhash} or \texttt{mktexlsr}.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the \texttt{.dtx} source file. It can be extracted by AcrobatReader 6 or higher. Another option is \texttt{pdftk}, e.g. unpack the file into the current directory:

```
pdftk luatex.pdf unpack_files output
```
Unpacking with \LaTeX. The \texttt{.dtx} chooses its action depending on the format:

plain \TeX: Run \texttt{docstrip} and extract the files.

\LaTeX: Generate the documentation.

If you insist on using \LaTeX for \texttt{docstrip} (really, \texttt{docstrip} does not need \LaTeX), then inform the autodetect routine about your intention:

\begin{verbatim}
latex \let\install=y\input{luatex.dtx}
\end{verbatim}

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the \texttt{.dtx} or the \texttt{.drv} to generate the documentation. The process can be configured by the configuration file \texttt{ltxdoc.cfg}. For instance, put this line into this file, if you want to have A4 as paper format:

\begin{verbatim}
\PassOptionsToClass{a4paper}{article}
\end{verbatim}

An example follows how to generate the documentation with pdf\LaTeX:

\begin{verbatim}
pdflatex luatex.dtx
makeindex -s gind.ist luatex.idx
pdflatex luatex.dtx
makeindex -s gind.ist luatex.idx
pdflatex luatex.dtx
\end{verbatim}

5 Catalogue

The following XML file can be used as source for the \TeX Catalogue. The elements \texttt{caption} and \texttt{description} are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is \texttt{luatex.xml}.

\begin{verbatim}
<entry datestamp='$Date$' modifier='$Author$' id='luatex'>
  <name>luatex</name>
  <caption>The LuaTeX engine.</caption>
  <authorref id='auth:oberdiek'/>
  <copyright owner='Heiko Oberdiek' year='2007,2009,2010'/>
  <license type='lppl1.3'/>
  <version number='0.4'/>
  <description>
    LuaTeX is an extended version of pdf\TeX using Lua as an embedded scripting language. The LuaTeX project\#x2019;s main objective is to provide an open and configurable variant of TeX while at the same time offering downward compatibility.
  </description>
  <documentation details='Package documentation'
    href='ctan:/macros/latex/contrib/oberdiek/luatex.pdf'/>
  <ctan file='true' path='/macros/latex/contrib/oberdiek/luatex.dtx'/>
  <miktex location='oberdiek'/>
</entry>
\end{verbatim}

24
6 History

[2007/12/12 v0.1]
- First public version.

[2009/04/10 v0.2]
- Requires package ifluatex in version 2.0 to ensure \luatexversion.
- Updates the call of \directlua, the syntax has changed in LuaTEX 0.36.

[2009/12/02 v0.3]
- Unsetting of attributes updated for LuaTEX 0.37.

[2010/03/09 v0.4]
- Support for lua states removed.
- Calling tex.enableprimitives for used primitives.

7 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
